I. READING COMPREHENSION**CLIMATE CHANGE**

In the past ten years, warmer-than-average temperatures have been recorded around the globe, and scientists warn that temperatures may rise by 1.8–4°C before the close of the century. It is believed that this recent climate change has been caused by human activity, and especially by the emission of greenhouse gases. However, climate change is nothing new, of course: in the past, the globe has experienced many fluctuations in temperature, some of which have been notably extreme.

So why should we be worried? In northern European countries, having milder summers even seems quite appealing! However, nearer the equator, the hot weather is making deserts expand, and putting water resources under pressure. In Spain, it is thought that nearly a third of the country may become dry and arid, and six percent of Spain's soil has already been lost to desert. In some of the world's poorest countries in Africa, desertification has already cost lives, with the reduction of fertile land exacerbating the pre-existing problems of drought and famine.

Climate change is affecting the coldest extremities of the world, too, melting the ice in the Arctic and Antarctic. This is currently having a negative effect on local animal populations, such as polar bears, and it is not yet known what the wider implications might be. One alarming theory suggests that rising sea levels may result in severe flooding in many countries, including the UK and the USA, and make coastal areas vulnerable to an increased risk of tidal waves and tsunamis.

One thing is certain: if we do not act now, the earth will continue to heat up, perhaps irreversibly. We must take better care of our planet – before the problem gets too hot to handle.
